

Mandatory attributes, optional attributes and trustworthy card calculations

Complete register of 468 catalog entries | Evidence: 15 Aug - 14 Sep 2026

Policy layer	What this PDF specifies
Special attributes	Mandatory candidates and optional-in-observed-data fields for every by-product; unknown fields remain explicitly unresolved.
Price eligibility	Validate record identity, price type, date, unit and selected attribute combination before calculating market-balanced average min/max.
Arrival eligibility	Count unique arrival events once; require an interpretable unit; separate them from price quotes.
Card interaction	Manual attribute slides with stable labels, recalculated prices, separate price/arrival coverage and honest timestamps.

23 entries have empirically always-filled attributes. Seven catalog entries have a user-defined maize moisture rule. Together these give 28 entries with a proposed special-attribute requirement. The remaining 440 have no established mandatory special attribute in this evidence.

E = empirical candidate, pending business validation. D = your stated maize grade rule. Neither column alone approves production pricing. Common price and arrival safeguards apply to every entry.

1. What “mandatory” means in this report

Two sources of requirement

D: a business rule you explicitly supplied, such as Maize Grade A requiring 11-14% moisture. E: a field filled in 100% of the matched monthly records. E identifies candidates for an agreed required-field policy; it does not prove price influence, correctness, or application enforcement.

Optional means missingness was observed

The optional column contains fields populated in some records but missing in others. This is optional in the observed data only. It does not mean the field is commercially irrelevant. If a user selects an optional field value, that field becomes required for that selected slide.

Missing evidence is a third category

Fields never populated, fields absent from the export, and by-products with no matched records cannot be confidently classified as optional. The final register keeps them in an unverified column. Matrix ticks alone do not determine mandatory status.

Why the 100% rule alone does not clean this month

Every current record already has each empirically always-filled field by definition. Requiring E fields therefore removes zero records from the same data used to discover them. The rule can detect future regressions; validity checks and business requirements are needed to reject unsuitable existing records.

No established requirement is not an empty schema

For the 195 matched entries without any E field, do not silently declare all special fields unnecessary. A generic, clearly labelled all-attributes price view may be possible after the common price gates; a grade-specific or attribute-specific claim needs a validated rule. No-record entries cannot produce a current price.

Small samples and catalog identity

Ten of the 23 E entries have fewer than 30 records. This is a caution flag, not a formal confidence threshold. There are 218 matched entries, 250 unassessed entries and 882 unresolved source records. The register preserves these limits rather than borrowing data across customer-facing divisions.

2. Price eligibility: which records belong in a slide?

Gate	Required condition	If the gate fails
Identity and scope	Confirmed product/by-product identity, reporting date/window, chosen geographic scope, stable market identity and one price type.	Quarantine ambiguous identities; do not blend price types.
Price validity	Numeric finite Minimum and Maximum; both > 0 ; Minimum $\leq$ Maximum; confirmed currency.	Exclude from the price calculation; retain a reason code.
Rate unit	Verified pricing basis and conversion: e.g. PKR per 40 kg. Convert both min and max to that same basis.	Do not mix or average unknown/incompatible bases. Arrival-unit weight is not automatically price-unit weight.
Mandatory special fields	All approved required fields are present, parseable, allowed and mutually consistent. E fields become enforced only when adopted into the product rule.	Exclude from the validated attribute-specific price pool. Keep an audit count.
Selected slide	Exact match on every selected attribute value; for a composite slide, the complete observed tuple must exist.	Do not include in this slide. Missing color cannot be assumed Golden.
Quote identity / revisions	Keep the latest accepted revision of a unique quote observation; remove duplicate ingestion using stable source/quote IDs.	Do not guess that same market/day/rate means duplicate: records may be distinct observations.
Coverage	Publish the chosen time window and qualifying price-market count; review stale or unusually thin coverage.	Use an unavailable/limited-coverage state as appropriate; never substitute zero.

The export has Date but no stable quote ID, revision timestamp, source ID, independent price unit or arrival-event ID. These metadata must be supplied or reliably resolved before claiming production-safe aggregates. This PDF defines the policy; it does not certify the current export as ready for all calculations.

3. Calculate average minimum and average maximum

Recommended default: equal market weight

Within one by-product + price type + selected attribute tuple + date + geographic scope + normalized rate unit, use one accepted latest quote per source/market/tuple/day. Average legitimate source quotes inside each market first; then give each contributing market one equal vote. This prevents prolific sources from dominating the card.

Step	Calculation
Within market m	$\text{marketMin}(m) = \text{sum}(\text{valid normalized quote minima in } m) / \text{quote count in } m$ $\text{marketMax}(m) = \text{sum}(\text{valid normalized quote maxima in } m) / \text{quote count in } m$
Across M price markets	$\text{Card Avg Min} = \text{sum}(\text{marketMin}(m)) / M$ $\text{Card Avg Max} = \text{sum}(\text{marketMax}(m)) / M$
Multiple days	Calculate each market-day summary; average daily values within each market over its valid days; then average market summaries equally. Label the interval and show coverage days. Do not silently reuse latest quotes as historical daily observations.
Rounding	Round only the final displayed value. Show “Avg min / Avg max”; these are averages of quoted lower/upper bounds, not absolute national extrema.
No eligible prices	Display “Price unavailable”; show zero contributing price markets. Do not show Rs 0 or reuse another slide’s value.

Worked example: why market balance matters

Market A submits two valid quotes: 100-120 and 110-130. Market B submits one: 150-170. Market A becomes 105-125 and Market B 150-170. The card displays Avg Min 127.50 and Avg Max 147.50. Directly averaging all three quotes would produce 120 and 140 and give Market A twice the weight.

Avoid arrival-weighted price averages for now

Arrival coverage is incomplete and arrivals may repeat across quotes. Do not weight prices by arrival unless the weights represent distinct, validated, comparable quantities attached to the exact same market and attribute scope.

4. Arrivals require their own eligibility rule

Prices and arrivals are different observations

A missing arrival must not automatically invalidate an otherwise eligible price quote. A valid arrival event may remain usable even when a price is missing. Keep separate eligible pools and report separate market counts when their coverage differs.

Gate	Arrival rule
Grain of the source	Confirm whether a row reports a lot/event, a market-day total, or a repeated snapshot. Never sum a daily total repeatedly across rate types, reporters or updates.
Unique identity	Use arrival_event_id (or a governed market/day/batch identity) and keep the latest accepted revision. If no reliable identity exists, do not publish an unqualified total.
Quantity and unit	Require a finite nonnegative quantity and an interpretable unit. Verified zero means no arrival; blank or unverified default zero does not. Zero/unknown conversion weight cannot produce tonnes.
Conversion	If quantity means bags, mass kg = bag count x verified kg per bag. If it already means kg, use quantity directly. Divide kg by 1,000 for tonnes. Never infer which interpretation applies from the column name alone.
Attribute scope	A Golden + New slide can sum only events reliably attributed to Golden + New. Do not allocate a whole market total to every color or every price type.
Time window	Sum distinct events in the selected window. For cumulative market-day totals, take the authoritative latest total per market-day, then sum across days; do not sum each update.
Coverage label	Prefer “Reported arrival” with arrival-market count. A national selection means reporting markets across Pakistan, not complete nationwide capture. If arrival is for all attributes while price is filtered, label it explicitly “All-attribute arrival”.

Observed issue: 883 records have a positive arrival and Arrivalsunit = 0. They cannot be converted into a reliable weight total using this export alone. 1,006 rows share a date/product/by-product/province/district/station/price-type key with another row; this is a collision count, not proof of duplicates.

5. How special attributes should appear on cards

Use manual slides with stable values

Keep the by-product name and its unique icon fixed. Place a compact selected-attribute label at the top right. Put a small page indicator next to it (for example, “1/3”), and allow swipe or explicit arrows. Keep the whole-card opening action visually distinct from the slide controls.

Situation	Card treatment	Calculation scope
One mandatory categorical field	Top right: “Golden 1/3”. Next slides: White, Yellow.	Selected color only; no color means no inclusion in a color slide.
Several mandatory fields	Use an observed tuple: “Golden · New 1/4”. Open the attribute selector if labels are long.	Match every field in that tuple. Use only combinations that exist, never a Cartesian product of all possible values.
Mandatory numeric field	Show a named band, e.g. “Moisture 11-14%”. Keep grade fixed.	Validated numeric values/ranges compatible with that grade. Do not turn each distinct moisture reading into a slide.
Optional field selected	Example: a user additionally chooses Origin = Quetta.	That origin becomes required for this view. Records missing origin remain eligible only for an explicitly unfiltered view.
No established mandatory attribute	Show a neutral general summary; optionally use “All reported colors” when aggregating known and unknown colors.	Use common price gates and clearly label mixed attributes. Do not show Golden beside a price that includes White and missing colors.
Attribute not recorded	Omit the attribute display or show “Not reported” on its detail view.	Never invent a value or convert a missing field to zero.
No eligible records for selection	Keep the selected label and show “No eligible prices”.	Do not slide automatically to another combination or display stale values from the previous slide.

Do not automatically cycle price-bearing slides: numbers can change while someone is deciding. A user-initiated swipe can animate the transition, but the selected label, prices, arrival and counts must update together. Respect reduced-motion settings and avoid animated fake price fluctuation.

6. Counts, timestamps and maize-grade exceptions

Separate counts when necessary

Use “48 price markets” for the price pool and “31 arrival markets” for the arrival pool. If one compact market count is shown, define it as the price count and make arrival coverage available next to arrival or in details. Do not imply one count validates both datasets.

Timestamp meaning

“Latest price report 1m ago” identifies the newest included price observation; it does not mean every contributing market refreshed a minute ago. “Calculated 1m ago” is a different timestamp. The present export has only Date, so it cannot substantiate a minute-level update label. Do not derive it from the time the screen opened.

Maize grade	User-supplied moisture band	Current raw evidence
A	11-14%	559/1,117 moisture-filled; 525/559 reported ranges extend outside the band.
B	14-16%	179/283 moisture-filled; 167/179 ranges extend outside the band. New/Old is 283/283.
C	16-18%	98/200 moisture-filled; all 98 reported ranges extend outside the band. New/Old is 200/200.
D	18-20%	No matched records; the declared moisture requirement still exists.

Apply the grade requirement as D, not an empirical guess

Moisture is D-required for Maize Grades A-D, including their separate Feed catalog entries. Missing or out-of-band moisture must not enter the verified-grade slide. B and C also have E-candidate New/Old. Do not silently relabel out-of-band records to a different grade.

Boundary and range validation

The written bands touch at 14, 16 and 18. For validating an already labelled grade, compare against its declared band. Before automatically assigning a grade from moisture, define non-overlapping boundaries with the business owner. Also resolve reversed endpoints and interval-vs-point semantics; a range midpoint is not a measured average.

7. Decision examples and release rules

By-product	Mandatory / optional decision	Resulting card policy
Wheat	E: none. Optional observed: Color, New/Old, Variety, Specifications, Quality.	Do not pretend the Golden attribute is universally present. A Golden filter can require color locally; a general view must say it mixes attribute states.
Maize Grade A	D: Moisture. Optional observed: Color and New/Old.	Validate 11-14% first. Color/New selections further narrow the record pool; moisture alone does not guarantee price/unit validity.
Maize Grade B	D: Moisture. E: New/Old. Optional observed: Color.	After adopting New/Old as required, allow grade-valid New and Old views only where those values actually occur.
Millet Grade B	E: Color and Origin, both complete in 25 records.	Use actual color-origin tuples if approved; retain the small-sample flag. Do not infer that other millet grades have the same rule.
Seed Cotton Grade B	E: Color in 244/244 records.	A manual color slide is a strong availability candidate; still check allowed values and separate price types.
No matched records	Mandatory unknown, except explicit D rules. Optional unknown.	Show unavailable data until matching records and business requirements are resolved.

Record exclusion must be visible to the team

For every calculation retain eligible record count, excluded count by reason, price-market count, arrival-market count and the selected filters. Reject and investigate bad rows; do not silently erase their existence or imply that the remaining sample is the entire market.

Version the policy

Approve required fields per by-product with the domain owner; version the rule and effective date. Recheck completeness on future data. A field missing next month should trigger a data-quality exception rather than disappearing automatically from the mandatory list.

8. Complete by-product register: how to read it

The following pages contain all 468 entries in the audited matrix, grouped by customer-facing division. ID preserves catalog order; the matching Excel row is ID + 4. English labels are retained; parenthetical Urdu equivalents are omitted for table readability.

Column	Interpretation
Mandatory special attributes	D = your explicit grade requirement. E = empirical 100%-filled candidate, pending adoption. No established field means the evidence cannot set a universal special-attribute requirement.
Optional in observed data	Partially filled special fields after removing D requirements. Each lists filled/total. Their absence alone does not prove that omission is safe commercially.
Unverified / not observed	Special fields with no populated values in matched records. For zero-record entries all special fields remain unassessed; matrix-ticked fields are listed as expectations only. Rate and Mill Name are unassessable for every entry because their columns do not exist in the export.
Evidence	N = source records; d = reporting days; <30 = small sample. “No attributable records” includes unresolved identity mappings.

Register vocabulary: Moisture, Color, New/Old, Origin, Variety, Specifications, Quality. Neither a schema tick nor an always-filled metadata field makes an attribute a proven price driver. Common identity, date, price, unit and lineage gates apply to all 468 entries.

A single monthly export is not a permanent mandatory-field contract. This register is a reviewable proposed policy, and deliberately preserves unknowns.

Wheat | 10 catalog entries

D: declared grade rule. E: 100%-filled candidate. Optional: partially filled in this month. Unknown is not optional.

427 / Zafran / Zafran	No attributable records	Not determined	Unknown	All unassessed. Matrix expects: Specifications

9. Identity exceptions and source references

The 882 records below are not silently assigned to a catalog entry. They require a business-approved identity mapping before they can change mandatory-field decisions.

Source product	Source by-product	Records	Why unresolved
Other Varieties	Egg Tray	4	No scoped identity match
Other Varieties	Quinoa	155	No scoped identity match
Rice	Paddy Irri-Fine	57	Multiple matrix identities; not assigned
Vegetable	Potato (Goli)	24	Ungraded potato cannot establish Grade A identity
Vegetable	Potato (Laal)	116	Ungraded potato cannot establish Grade A identity
Vegetable	Potato (Lr)	30	Ungraded potato cannot establish Grade A identity
Vegetable	Potato (Mozika)	337	Ungraded potato cannot establish Grade A identity
Vegetable	Potato (Santa)	158	Ungraded potato cannot establish Grade A identity
Vegetable	Potato (Sufaid)	1	Ungraded potato cannot establish Grade A identity

Source records: All Commodity Prices - 15-Aug-2026 to 14-Sept-2026.xlsx, Commodity Prices, header row 7 and records in rows 8-40,966 (40,959 actual records).

Catalog: Zarai_Mandi_Customer_Face_Attribute_Matrix_Audited_Aug15-Sep14.xlsx, Attribute Matrix, rows 5-472. Completeness counts and matching are carried forward from the preceding 127-page completeness report, with the maize D rules explicitly added here.

Nulls, whitespace and explicit placeholders count as missing. Numeric zeros count as present and require separate interpretation. Completeness is scoped by catalog identity; source names are normalized and aliases are explicit. No duplicate ingestion or arrival-event lineage is inferred from coincident values.
